The processing chain

NDSI

(normalized difference snow index)

$$\text{NDSI (Terra)} = \frac{R04 - R16}{R04 + R16}$$

$$\text{NDSI (Aqua)} = \frac{R04 - R21}{R04 + R21}$$

- **As Aqua has a faulty 1.6 micrometer channel, 2.1 micrometer NIR channel is being used (only Aqua)**
- **Terra and Aqua snow mapping is effectively a separate pipeline, requiring separate snow calibration data sets.**
- **Issues:**
 - **NDSI (R04 , R21) is known to result in somewhat smaller dynamic range of NDSI values -> Aqua snow maps are more sensitive to error.**

NDSI snow free calibration

The reflectance model:

$$R = f * R(\text{snow}) \\ (1 - f) * R(\text{snowfree})$$

- **Linear reflectance snow model being used to model the NDSI - snow fraction relationship ****
- **For Iceland found it necessary to develop a snow-free NDSI map for calibration.**

- Currently doing 1 day mosaics in production
- **UPDATE PIXEL IF:**
 - IF “data available in new overlay” AND
 - IF “new px. data resolution < 120% previous px. data resolution”
- **#1 ensures a good resolution - “near - overhead” satellite pass has higher priority than passes sampling near the swath perimeter**
- **#2 ensures that mosaic keeps updating despite “bad resolution passes”**

- **SCDA Opaque cloud algorithm is very effective at identifying most opaque and translucent clouds.**
 - **However, added the split window $BTD > 3K$ transparent cloud filter for good measure.**
- **SCDA leads to erroneous identification in snow cover perimeter - particularly mountainslopes - perhaps associated with non-vegetated areas**
 - **added a fix based on low NIR-reflectance, black-body and 'ground-like' seasonal temperature requirements**
- **Cloud shadows and thin cloud edges pose a problem for the quality of the NDSI mosaic**
 - **devised a cloud-mask blurring filter, convolving the cloud mask with a half-disk**

NDSI snow-free calibration (DRAFT)

Example snow maps

- Have repeatedly tuned and re-analysed snow maps in the thawing period from from 29 April till July 2012.

Snow fraction mosaic - Iceland (DRAFT)
MODIS (Terra) 2012.05.06 13:10

Snow fraction mosaic - Iceland (DRAFT)
MODIS (Aqua) 2012.05.06 13:25

Verification attempt with the IRA web cameras

- Road cameras maintained by the Icelandic Road Authority at weather stations were used for an initial comparison / verification of the MODIS snow fraction product.
- Web camera frames can be automatically analysed simplistically for snow fraction using a threshold on the image brightness
- Generally do not agree well on actual snow fraction
 - perhaps localization near roads?
 - or are the snow-maps wrong?

Steingrímsfjarðarheiði séð til austurs⁵⁰ A 6 m/s 4°C

Verification attempt with the IRA web cameras

Wet or old snow?

- The NDSI has a secret, additional information on the state of the snow cover.
- Some use $NDSI > NDSI_{(100\% \text{ snow})}$ as evidence for snow-age or snow grain size
- It has also been noted that wet snow reduces to larger effective grain sizes
