Coastal wind from Synthetic Aperature Radar

Birgitte Rugaard Furevik (MET Norway & DMI), Knut Frode Dagestad and Ivar A. Seierstad (MET Norway)

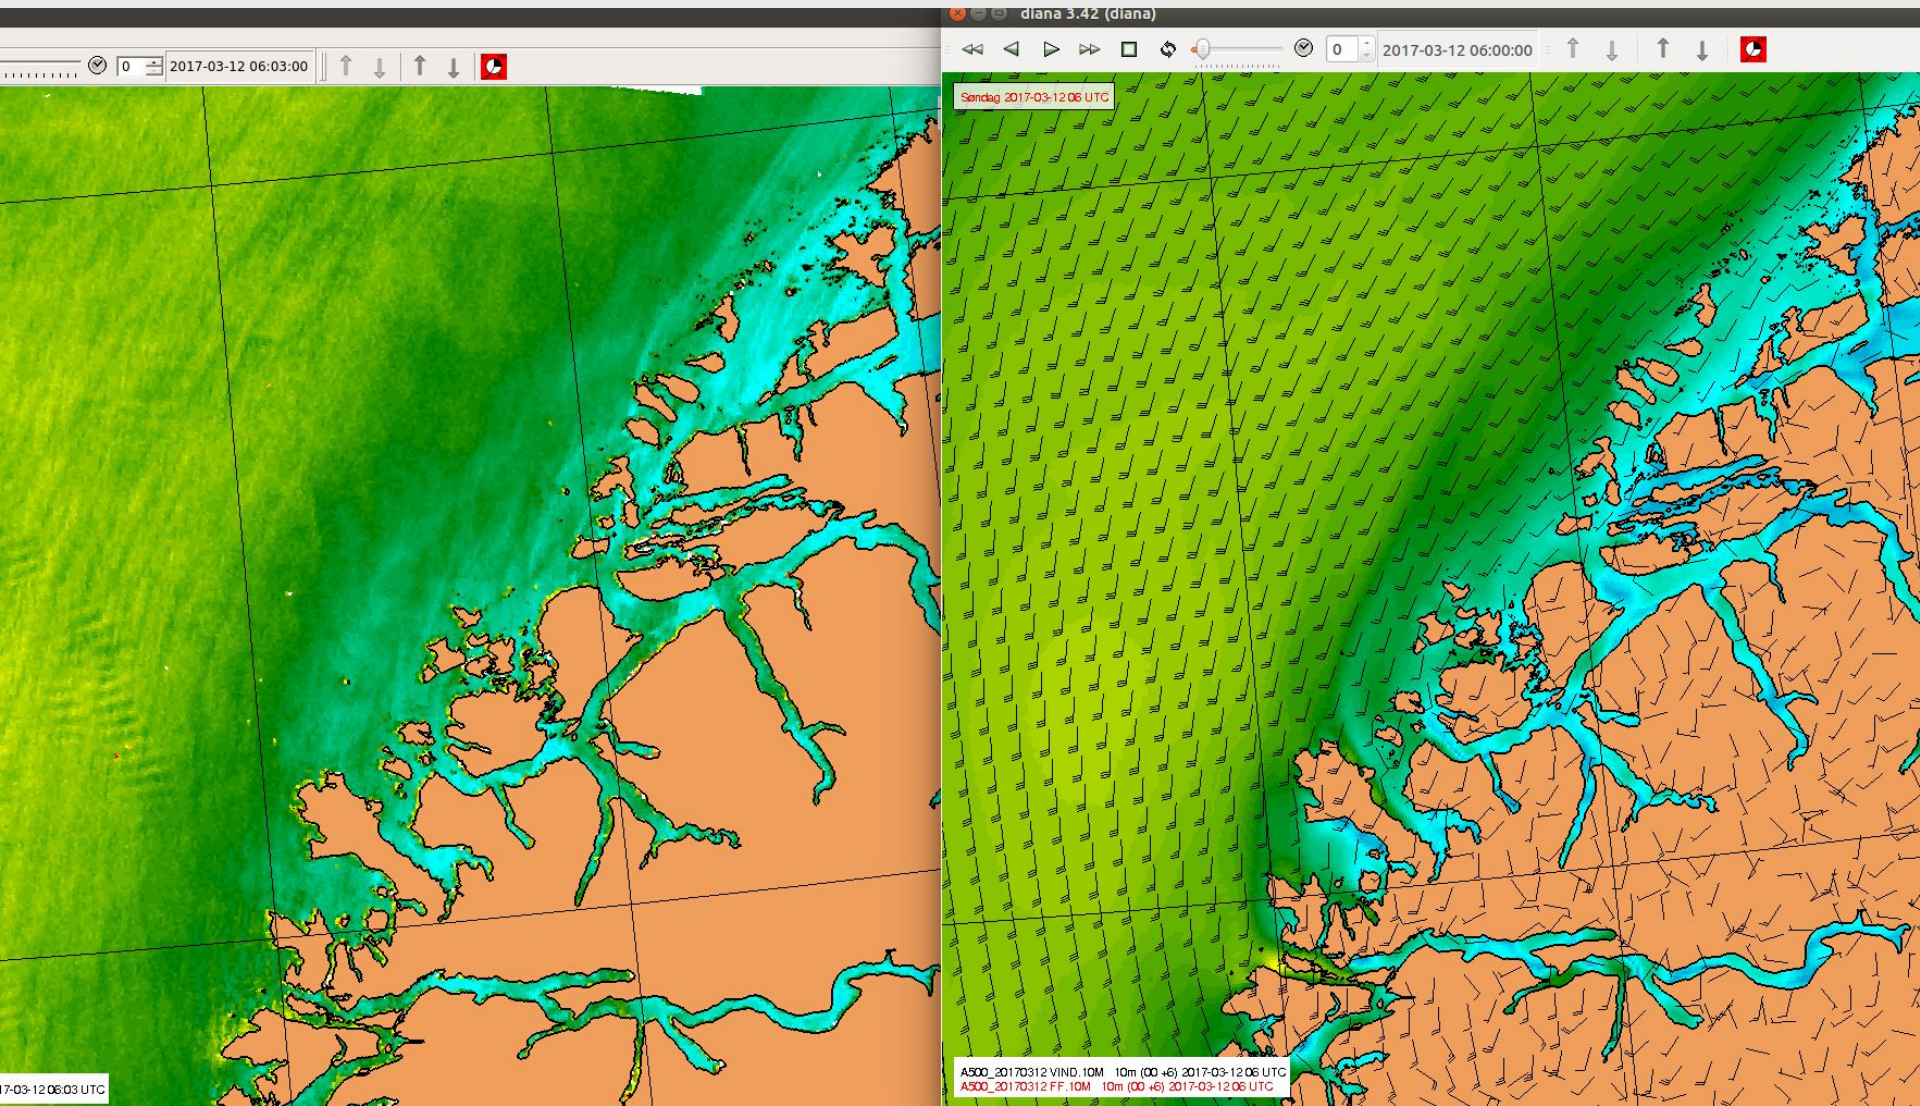

Project Metvind funded by the Norwegian Space Center

19.06.2018

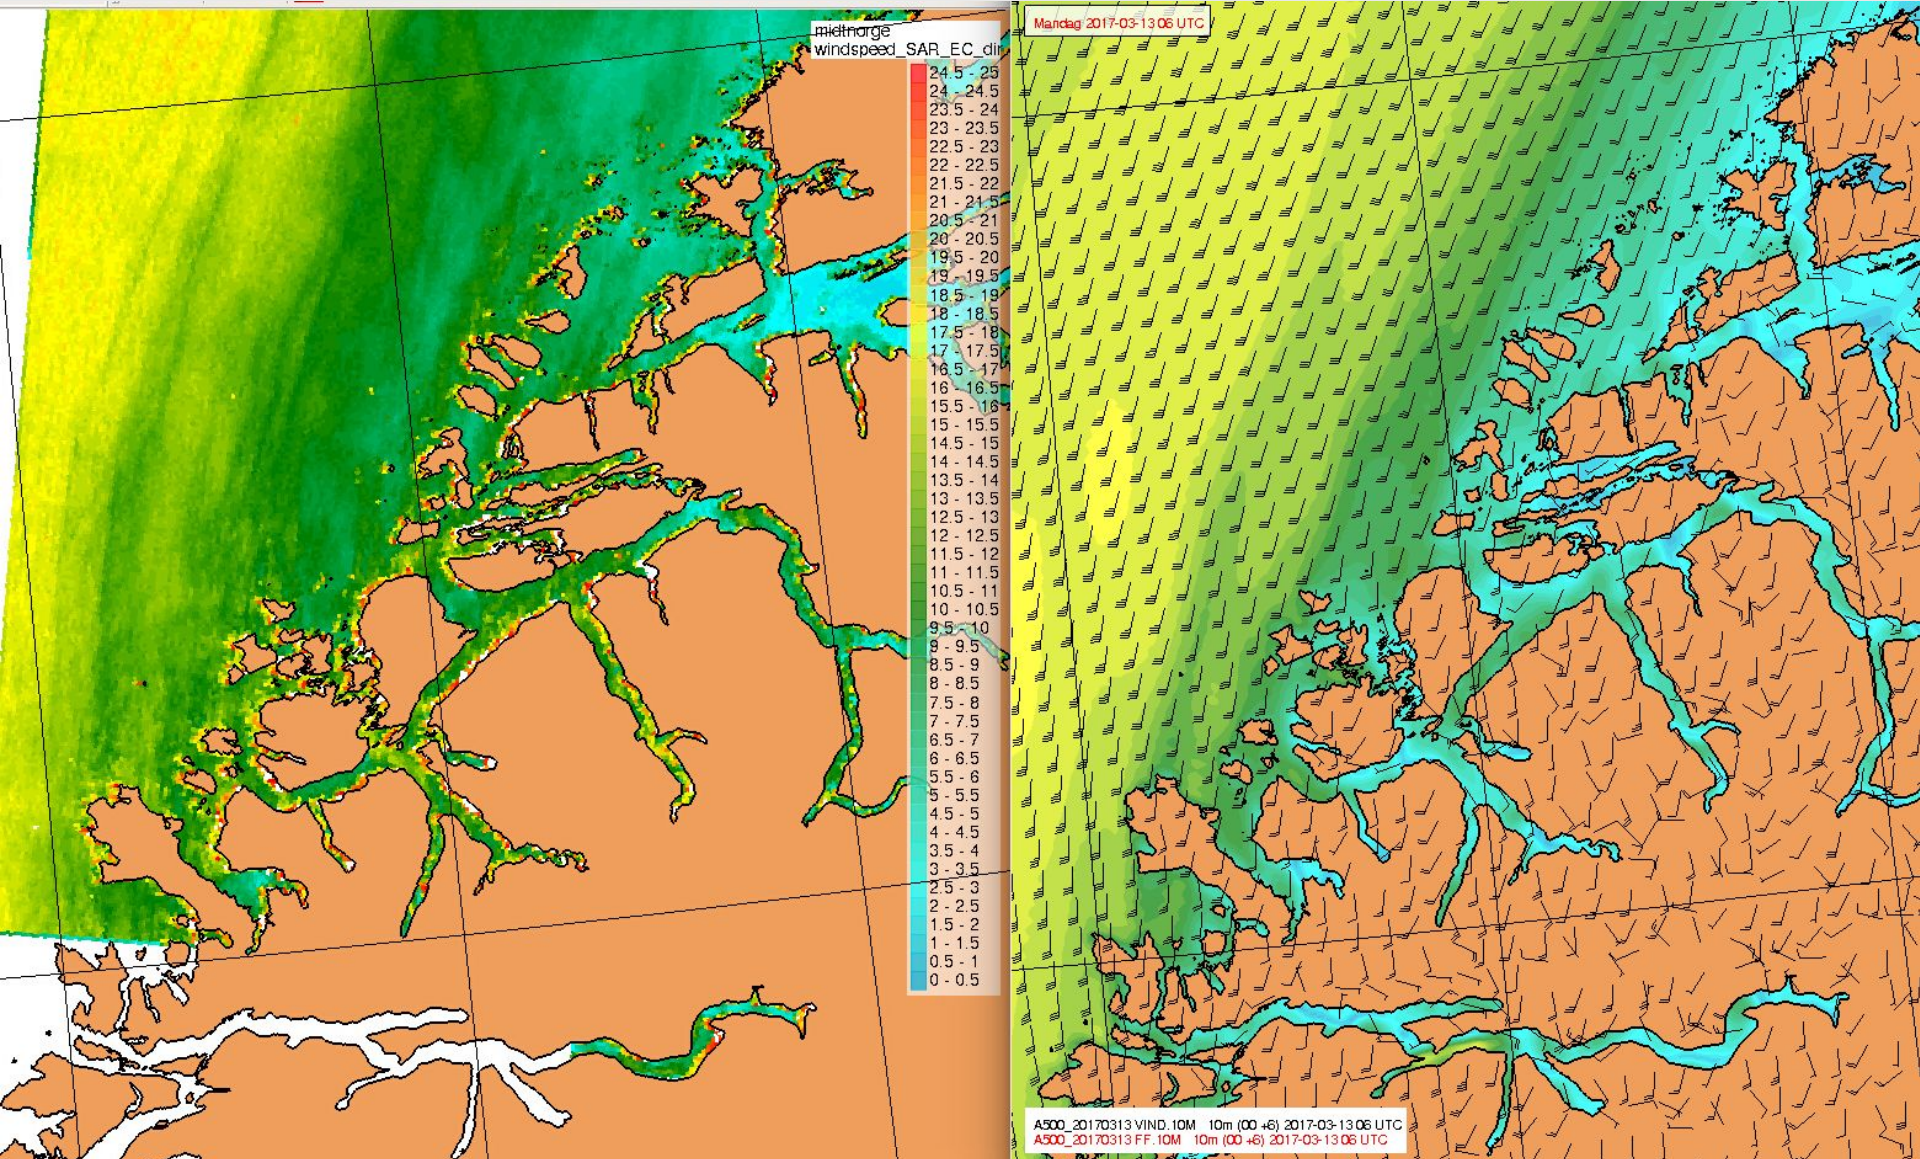

Can we use SAR to calibrate coastal wind in AROME MetCoop 2.5km forecasts?

SAR and AROME 500mx500m 10m wind

SAR and AROME 500mx500m 10m wind

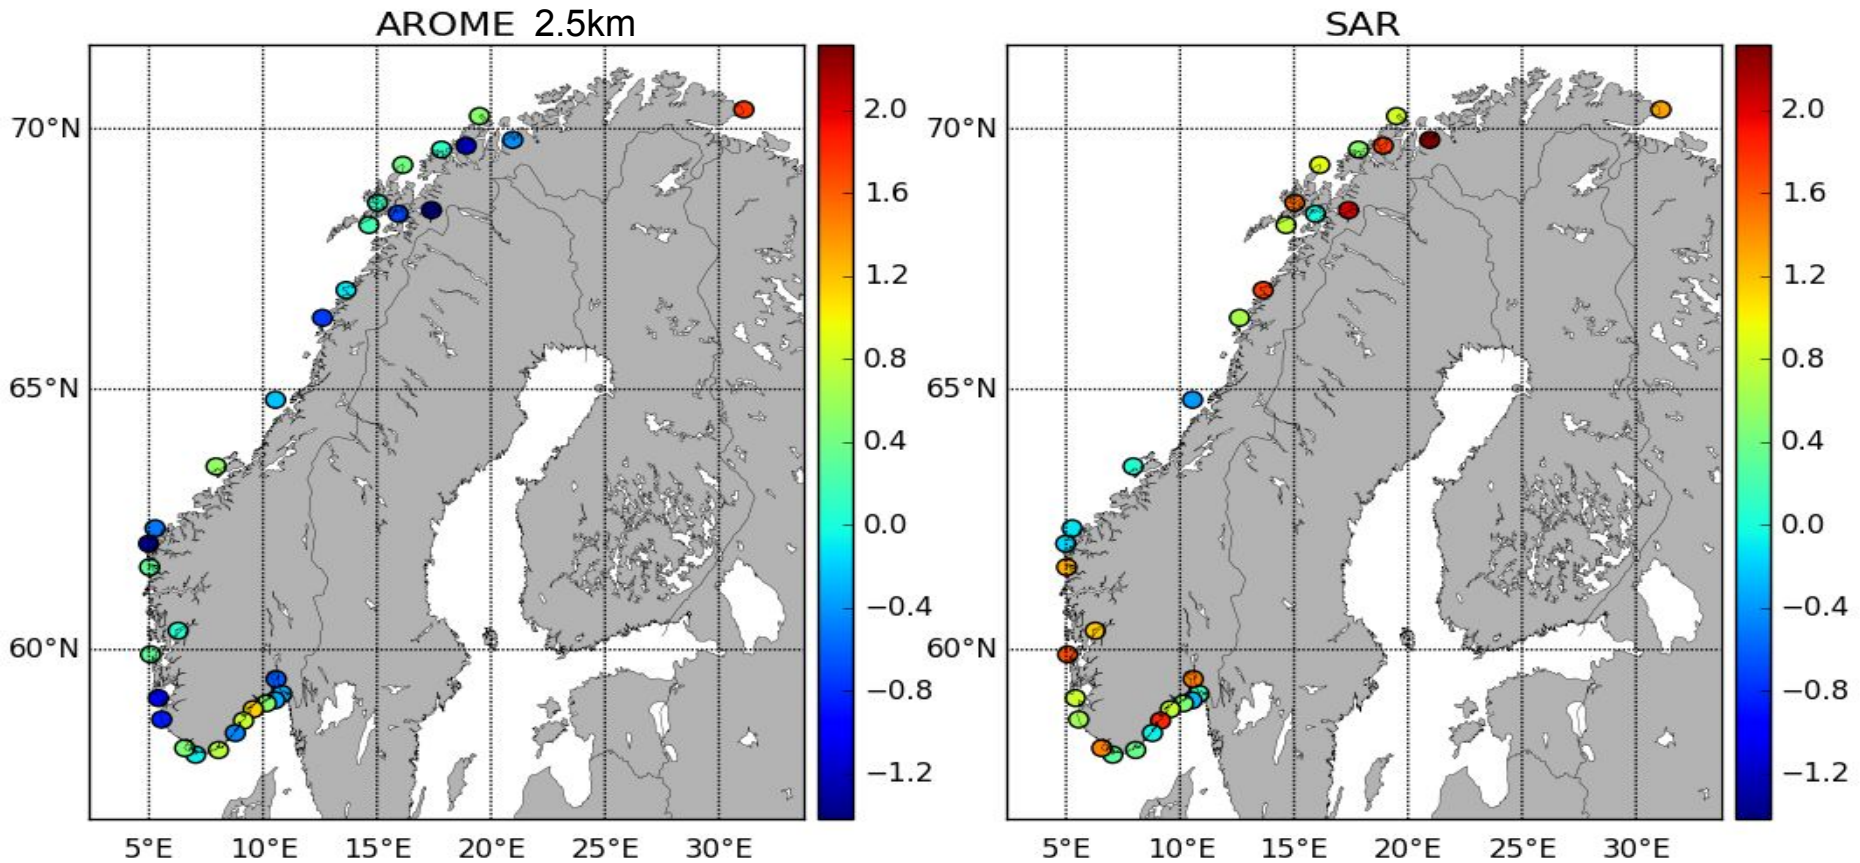

Synthetic Aperture Radar

- Sentinel 1 A & B
- SAR measures sea surface roughness
- Roughness is mainly dependent on wind speed and air-sea temperature difference for wind speed above $\sim 3\text{m/s}$
- Conversion to 10m wind speed is dependent on external wind direction (e.g. from a model)
- A value is calculated over all of the image - even over land, ships, platforms etc.

Three data sets:

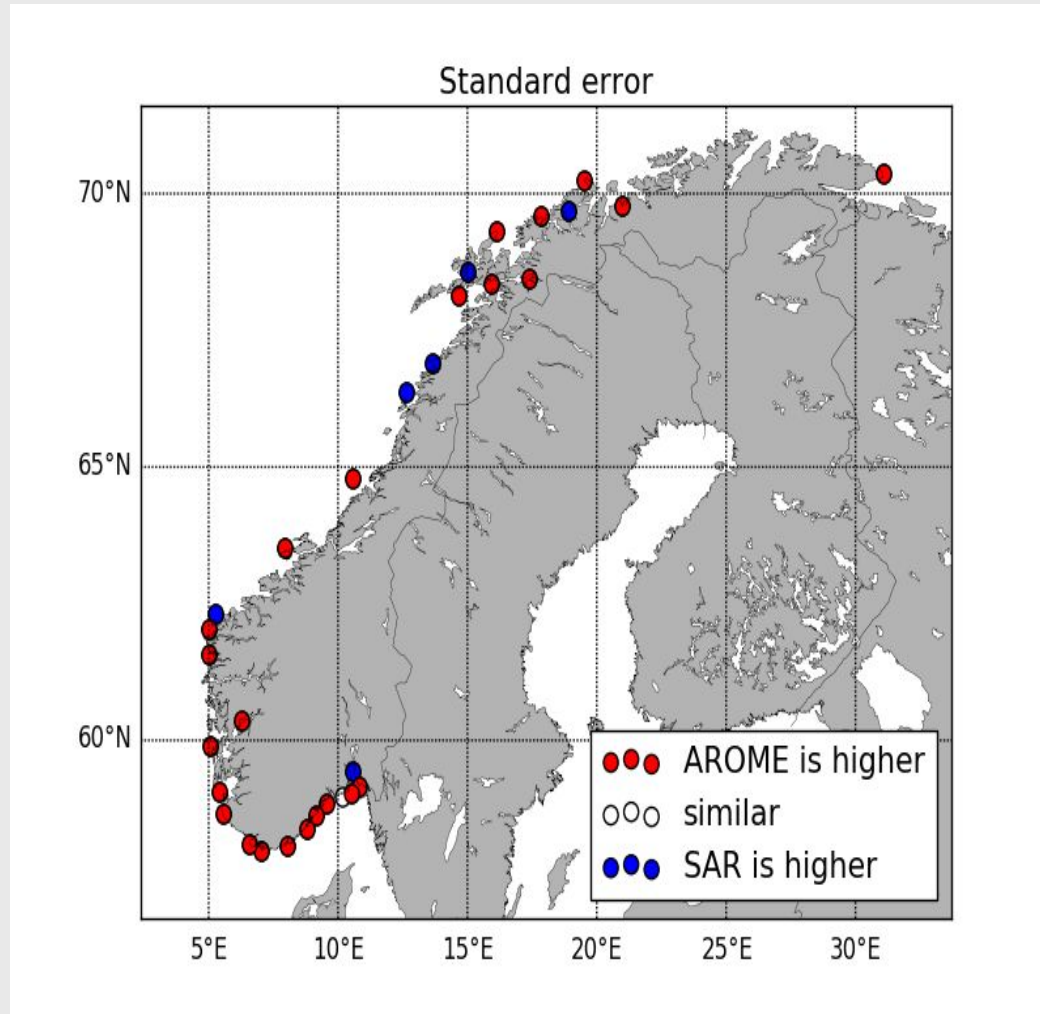

- NERSC/MET processing Level-1 data using Nansat and OpenWind software (available on github)
- Danish Technical University (DTU) on satwinds.windenergy.dtu.dk
- ESA Ocean (OCN) Level-2 product on colhub.met.no

Bias to coastal stations

OCN OWI product

Quality flag:
consistency_between_wind_inverted_and_NRCS_
and_Doppler_measured'
flag_values = [0 1 2 3]
flag_meanings = 'good medium low poor'

Operational use: wind speed and backscatter

Wind speed (medium-good quality)

Normalised radar cross section (NRCS)

SAR backscatter can not be properly interpreted to wind speed without wind direction and antenna look direction

Summary

Testing of three different SAR wind products:

More frequent 5-9m/s winds in SAR in NERSC/MET product

Geolocation errors in NERSC/MET and DTU products

Sentinel level-2 OCN wind product with quality flag and bright target removal is promising. Coarser resolution of 1km.
